

# Pyxis® Nursing Data Collection

Helping guide the patient care process

As a Nurse, you're expected to quickly collect and organize a wealth of data—plus research and record patient “intakes” and “outputs”—to manage the patient care process. With less and less time to process more and more information, a care management system is needed to reduce labor intensive manual processes so you can spend more time with your patients.

Designed by Nurses for Nurses, Pyxis Nursing Data Collection is powerfully effective in its ability to streamline workflow. The system enables Nurses to automatically capture, organize and review important patient monitoring data collected at the point of care—and instantly and securely disseminate this information to appropriate individuals, on or off campus, so clinical decisions can be made automatically. Pyxis Nursing Data Collection also helps you fulfill documentation requirements efficiently.

Pyxis®

## Facilitate patient-centric data collection

- Capture vital signs information effortlessly from bedside monitors using the integrated infrared reader on your handheld device
- Improve the accuracy of vital sign documentation using the infrared reader
- Monitor vital signs effectively with “out-of-bounds” alerts that tell you instantly when something is wrong and prompt the clinician to report critical values
- Define blood-pressure measurements easily using handy drop-down fields
- Capture intake and output information, with optional role-based review

## Improve Nursing efficiency

- Customize vital signs value parameters per hospital preferences
- Give authorized users quick access to up-to-date, accurate patient information anywhere within the wireless network
- Enter point-of-care data in real time to reduce potential errors or omissions
- Configure simple, logical templates to your hospital’s specific needs
